TITLE: Optimizing distribution systems for the best division between various forms of transport

SOURCE: AN SSSR. Izvestiya. Energetika i transport, no. 1, 1966, 108-112

TOPIC TAGS: pipeline transportation system, railway transportation, inland waterway transportation, mathematic model, petroleum product

ABSTRACT: The authors present a mathematical economic model of a problem dealing with the optimum distribution of load transportation between different types of transport which takes into consideration the existing varieties of rolling stock. The model was calculated on a computer for the case of optimum load traffic systems for petroleum products shipped from the Bashkir region to the industrial center of the European SSSR. The results of these calculations are given. The main changes in the transportation system for petroleum products with respect to the optimum system is that transportation of petroleum products to Leningrad, Yaroslavl', Gor'kiy, Kambarka has been completely transferred to waterways. The transport capacity of the petroleum fleet is the only limiting factor as to the amount of stock transported along the Belaya River. Tables are given for the optimum system and a modification which includes the

TITLE: Intermittent-current Nickel Plating (Nikelirovaniye s primeneniyem pereryvov toka)

PERIODICAL: Tekhnol. transp. mashinostroyeniya, 1957, Nr 7, pp 21-23

ABSTRACT: It is noted that the reversal of current that has come into use recently in electroplating is not of adequate efficiency for all processes or fully applicable to them. It was established that in nickel-plating (N) with current reversal, positive results are obtainable only with a positive impulse representing a small quantity of electricity ($\leq$0.5-0.6=a-c/dm^2) and when the ratio of the cathodic and anodic periods is ($t_k/t_a \geq 10/1:15/1$). Moreover, N with current reversal has the serious shortcoming that the electrolyte may gain in ions of the base metal (Fe). A more efficient method of N was investigated, based on an intermittent current, with an electrolyte of the following composition (in g/liter): $NiSO_4 \cdot 7H_2O$ 250, $Na_2SO_4 \cdot 10H_2O$ 60, H_3BO_3 50 NaCl 5; pH 4.3-4.4; D_k = 2-2.6 a/dm^2; duration of electrolysis 4-5 sec, length of interruption in current 1 sec, temperature of electrolysis 18-20°C, current efficiency

Card 1/2

137-58-4-7862

Intermittent-current Nickel Plating

about 97 percent. Intermittent-current N results in a coating of lower porosity (0.49 pore per cm^2 surface area) relative to that with coatings produced in the same electrolyte with constant current (0.75 pore per cm^2 surface area). Compressive stress in the coating is diminished, and fatigue and corrosion fatigue resistance of the nickel-plated parts is increased under conditions of loads of alternating sign. Intermittent-current N makes it impossible for Fe ions to accumulate.

KURAKINA, T. I.

PHASE VELOCITY OF ELECTROMAGNETIC WAVES IN THE FREQUENCY RANGE FROM 1 TO 25 kc (USSR)

Mikhaylova, G. A., and T. I. Kurakina, Geomagnetizm i aeronomiya, v. 3, no. 2, 223-226. S/203/63/003/002/004/027

The average phase velocity of electromagnetic waves produced by atmospherics was investigated during the period of March-June 1962. Experiments were carried out simultaneously at the Institute of Terrestrial Magnetism and Radio Wave Propagation, Academy of Sciences (IZMIRAN) USSR (Moscow), and the Main Geophysical Observatory (Leningrad). The atmospherics recorder installed at IZMIRAN had a frequency response from 50 cps to 60 kc, while the frequency response of the recorder used at the Main Geophysical Observatory was from 20 cps to 200 kc. Immediately after the reception of each atmospheric, a pulse produced by the time base of the IZMIRAN recorder was delivered by direct line to a synchronizing transmitter of a radio direction-finder network, and a short pulse was transmitted and received instantly at radio direction-finder points in Murmansk, Minsk, Moscow, Kiyev, and Rostov on the

Doh, where the directions of the arriving atmospheric were visually recorded. In Leningrad and Moscow the form of the arriving atmospheric was recorded simultaneously. As was demonstrated by the observations, in the majority of cases the signals recorded at these two points corresponded to the same lightning discharge. Average phase velocities of electromagnetic waves in the frequency range of 1-25 kc were determined by harmonic analysis of the atmospherics. Eleven pairs of atmospherics were recorded in Moscow and Leningrad simultaneously during day hours from distances greater than 1000 km.

TITLE: A method for checking the input circuits of multichannel seismographic equipment. Class 42, No. 181830 [announced by the All-Union Scientific Research Institute of Geophysical Exploration methods (Vsesoyuznyy nauchno-issledovatel'skiy institut geofizicheskikh metodov razvedki)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 10, 1966, 85

TOPIC TAGS: seismography, multichannel analyzer, electronic equipment

ABSTRACT: This Author's Certificate introduces a method for using direct current to check the input circuits of multichannel seismographic equipment. A resistor with a value considerably below the impedance of the input circuit is connected in series at the input to improve measurement reliability. The tiepoint between the resistor and the input transformer of the seismic amplifier is grounded, and a measurement circuit is connected between ground and the second pole of the input transformer.

TITLE: Reaction of reamination of bis(diethylamino)-derivative silanes and octamethylcyclotetrasilazane with aromatic amines

PERIODICAL: Zhurnal obshchey khimii, v. 33, no. 4, 1963, 1294-1299

TEXT: The compounds of bis(diethylamino)methylsilane, bis(diethylamino)ethylsilane, diethylaminophenylaminoethylsilane, and bis(phenylamino)ethylsilane, of which the first two have not been described previously in published literature, are synthesized. These compounds are liquids which evaporate in a vacuum without decomposing and are easily hydrolyzed in air. They react with benzidine to form polymers which are solids at room temperature.

Card 1/2

L 10663-63 S/079/63/033/004/008/010

Reaction of reamination of...

The properties of these polymers are studied and are given in a table. It is shown that the reamination of bis(diethylamino)-ethylsilane by aniline takes place without the displacement of a hydrogen atom from the silicon to the amino group.

TITLE: New synthesis method for methylbromosilanes and methylbromochlorosilanes

SOURCE: Zhurnal obshchey khimii, v. 34, no. 5, 1964, 1684-1685

TOPIC TAGS: methylbromosilane, methylbromochlorosilane, trimethylbromosilane, dimethylchlorobromosilane

ABSTRACT: Trimethylbromosilane and dimethylchlorobromosilane have been prepared by treatment of trimethylchlorosilane or dimethyldichlorosilane with hydrogen bromide in the presence of anhydrous $FeCl_3$ or iron filings. Either HBr gas or HBr generated by the reaction of bromine with naphthalene or tetralene can be used. Boiling points of the products are 79-80C and 93-94C, respectively. This work was done at the Moscow Institute of Fine Chemical Technology.

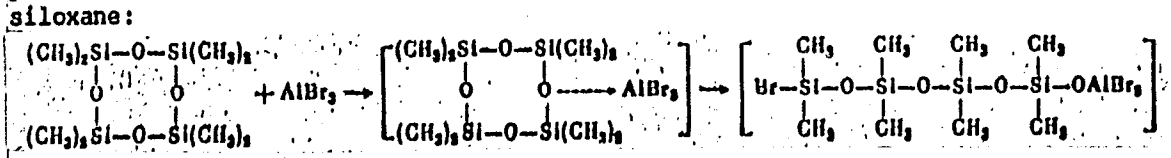
TITLE: Reaction of aluminum bromide with octamethylcyclotetrasiloxane

SOURCE: Zhurnal obshchey khimii, v. 36, no. 1, 1966, 105-107

TOPIC TAGS: organosilicon compound, aluminum compound, bromide

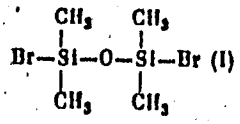
ABSTRACT: The reaction between octamethylcyclotetrasiloxane and aluminum bromide under various conditions and with various proportions of the reactants was studied. The authors found that the reaction proceeds in accordance with the mechanism proposed earlier for the reaction between aluminum chloride and octamethylcyclotetrasiloxane:



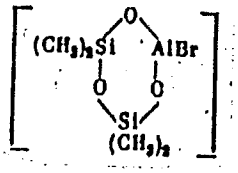
(I)

Card 1/3 UDC: 547.245 + 546.623

The product formed decomposes to form

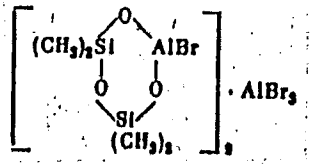


(I) and



(II)

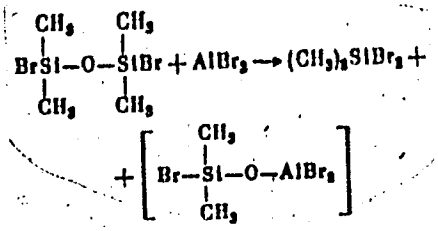
Two molecules of compound (II) then react with one molecule of AlBr to form the complex compound



(III)

Under more drastic conditions, the following reaction occurs during distillation of the products at atmospheric pressure:

L 16082-66
ACC NR: AP6005930



By changing the reaction conditions, one can obtain dimethyldibromosilane, tetramethyldibromodisiloxane, crystalline product (III), and higher α,ω-dibromopolysiloxanes with 3 and 4 silicon atoms. Orig. art. has: 2 tables.

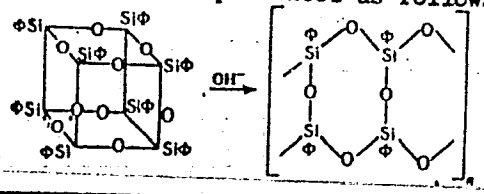
TOPIC TAGS: organosilicon compound, polymerization

ABSTRACT: The octamer $(C_6H_5SiO_{1.5})_8$ was synthesized in order to study the reaction of its polymerization which can be represented as follows:



Card 1/2

L 21188-66
ACC NR: AP6008047

2

where $\Phi = C_6H_5$ and the hydroxide serves as the catalyst. Polyphenylsilsesquioxanes with a reduced viscosity in 1% benzene solution equal to 0.487, 1.974, 2.2, and 5.84 were obtained. All readily formed transparent films with glass-transition temperatures above 400°C. Thermogravimetric analysis showed that the polymers have very high degradation temperatures. Heating to 900°C does not cause the degradation of the polysilsesquioxane part of the polymer; this sets these polymers apart from polyorganosiloxanes having linear and branched chains in which not only the organic part of the molecule but also the main chains undergo degradation. Orig. art. has: 1 table.
